### Asthma can be life threatening, especially if not treated.

#### Remember – **ASTHMA**:

- Airways Asthma affects the airways in your child's lungs. Three main things happen in your child's airways: 1) airways swell and make mucous, 2) muscles around the outside of your child's airways tighten, and 3) your child's airways become sensitive and twitchy.
- Symptoms Your child will cough more, wheeze, and/or be short of breath. Having more symptoms means your child's asthma is out of control.
- Technique & Triggers Have your child show a healthcare provider how he or she uses the asthma medicine devices to make sure they are being used properly. Everyone has different asthma triggers; know your child's triggers and how to avoid them if possible.
- Help Talk to a healthcare provider to learn more about resources that will help you manage your child's asthma. You can also go to the websites below to learn more.
- Medicine Know what your child's asthma medicine does. Your child should take his or her preventer/controller medicine every day even when feeling well.
- Asthma Action Plan Make a self-management plan with your child's doctor. Go to www.ucalgary.ca/icancontrolasthma/actionall to print an Asthma Action Plan.

### Checklist to Do at Home

Go back to the Emergency/Urgent Care	Department if:
<ul> <li>your child's symptoms get worse</li> </ul>	
versa elejele veljeverske se se leete leet	lla a ia 2 lla a i i ia

- your child's reliever/rescue lasts less than 3 hours
- your child can't talk in sentences without taking a breath
- your child's nails or the skin around the lips are blue
- you aren't sure what to do or feel you are having trouble managing your child's symptoms

	Make a follow-up	appointment with	your child's	doctor within	7 days of leavin	g the hospital.
--	------------------	------------------	--------------	---------------	------------------	-----------------

☐ If you have been referred for asthma education, contact the educator to make an appointment.
